EXAMINER'S AMENDMENT

The application has been amended as follows:

21. (Currently amended), An optical semiconductor device with a multiple quantum well structure, comprising: at least one combination of alternative well layers and barrier layers, both comprising various semiconductor layers, said well layers comprising a first composition based on a nitride semiconductor material with a first electron energy, said barrier layers comprising a second composition of a nitride semiconductor material with electron energy which is higher in comparison with the first electron energy, and a radiation-active quantum well layer for which the well layers and barrier layers form a superlattice, wherein the well layers comprise thin aluminum-indium-gallium-nitride layers and the barrier layers comprise gallium-nitride or aluminium-gallium-nitride layers which are thicker than the well layers and the radiation-active quantum well comprises an indium-gallium-nitride layer, wherein within at least one well layer of the superlattice, the In content increases in a direction of growth.

The following is an examiner's statement of reasons for allowance: The prior art does not teach the additional claim limitation, where the well layers of the first composition are essentially non-radiating well layers and below the active radiating layer, where the prior art teaches that some well layers do absorb the radiation, but do not specifically teach that they do not radiate and are located below the active radiating layer, thus this combination was found to be non-obvious; hence novel.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue
